

# Study 1b (RAIv1): Standardized Regression Coefficients Predicting Heart Manikin Scores After Controlling for Visits in a Mixed Model

Errors represent 90% (inner tick) and 95% (outer tick) confidence intervals  
 The vertical dashed lines represent the smallest effect size of interest (SESOL,  $|r| = 0.17$ )  
 (R) = Reversed hypothesized association. \* = Equivalent to zero. † = Undecided equivalence.
